Professional Summary

Senior Data Engineer and Data Migration Consultant with 7 years delivering scalable ETL/ELT pipelines, data quality frameworks, and reporting infrastructure for enterprise transformation programmes.

Expert in SQL (CTEs, stored procedures, window functions, complex queries) across SQL Server and PostgreSQL. Experienced in data profiling, data cleansing, validation, reporting, and migration involving millions of records.

Proficient in DBT, Apache Airflow, Tableau, Python, FastAPI, Data Warehousing, and AWS.

Built self-service data tooling, pre/post-load validation frameworks, and dashboards that enable operational teams to act independently. Track record managing data governance, access controls, and privacy-compliant handling across millions of records.

Authorised to work in the UK - No visa sponsorship Required

Programming Languages: SQL, Python, COBOL, UNIX Shell Scripting, JCL

Frameworks & Libraries: FastAPI, Django, Asyncio, Pandas, NumPy, SQLAlchemy

Databases: SQL Server, PostgreSQL, Teradata, DB2, AWS Aurora, AWS RDS, Amazon Redshift

Data Engineering & ETL: Data Integration, Data Migration, Data Transformation, Stored Procedures, CTEs, Query Optimisation, IBM DataStage, Syniti ADM/ADMM, SAP LTMC, LSMW, Query Orchestration

Data Quality & Governance: Data Quality Management, Pre/Post-Load Validation, Data Cleansing

Workflow & Scheduling: Apache Airflow, Autosys

Cloud Platforms: AWS, SAP Cloud, On-premises Environments

AI Tooling: Claude Code, OpenAI Codex, Gemini CLI

BP - Energy Sector

Jan 2025- Aug 2026

Senior Data Migration Consultant

- Led end-to-end data pipeline design and delivery for Material master migration (SAP ERP to SAP S/4HANA) across 80,000 material master records, owning the full lifecycle from construct development to load execution.
- Built automated pre-load and post-load validation and reporting infrastructure, tracking record counts and error rates across pipeline runs, accelerating business sign-off and enabling a controlled go-live.
- Developed complex SQL queries using CTEs and stored procedures to dynamically derive and transform source data. Wrote SQL functions to cleanse hidden/special characters, ensuring data quality before load.
- Built self-service analytical reports, including duplicate analysis, positive list, and configuration comparison reports, enabling business teams to make informed decisions independently without engineering support.

Senior Data Migration Consultant

- Developed and optimised stored procedures to manage continuous integration for business partner types, each with 60,000 header records across 15+ sub-tables, significantly improving pipeline throughput.
- Implemented field-level comparison logic across sub-tables, automatically classifying records as load-ready or flagging discrepancies for review, a data quality monitoring pattern.
- Built the data layer for self-service dashboards displaying pre-record load readiness, field-level change summaries, and drill-down error messages, enabling business teams to explore data and generate reports independently.
- Built post-load pipeline health queries tracking records processed, loaded, and failed per run, providing continuous visibility into pipeline reliability.
- Wrote SQL functions and CTEs to handle complex data transformation and cleansing within the integration pipeline, ensuring consistency across all BP types.

Corning Inc

Feb 2022 - Dec 2023

Senior Data Migration Consultant

- Built SQL-based data quality reports and monitoring dashboards tracking data completeness, accuracy, and timeliness across migration pipelines.
- Developed Python scripts for automated data profiling and anomaly detection, identifying inconsistencies in source data before transformation and load.
- Designed and optimised complex SQL queries using CTEs and window functions to extract, aggregate, and validate data across multiple source systems.
- Created reusable Python utilities for data cleansing and validation, handling edge cases and special characters to ensure clean loads into target systems.
- Collaborated with business analysts to define data quality thresholds and built automated alerting mechanisms to flag records exceeding tolerance levels.

Bank of America

Nov 2019 - Feb 2022

ETL Developer (DataStage)

- Designed and delivered end-to-end IBM DataStage ETL workflows for data migration from DB2 to Teradata Data Warehouse, contributing to pipeline design, performance optimisation, and data integrity.
- Wrote SQL queries and transformations within DataStage workflows to extract, cleanse, and validate data across migration and analytics initiatives.
- Developed UNIX shell scripts to automate post-load notifications with summary reports detailing records loaded vs expected, providing quick visibility into pipeline run outcomes.
- Scheduled and managed ETL job execution using Autosys, improving pipeline reliability and eliminating manual scheduling issues.
- Conducted UAT and end-to-end testing of ETL pipelines to verify data accuracy, completeness, and system reliability before go-live.

CERTIFICATIONS - [Verification Link](#)

- Certified Syniti ADM Developer - Syniti Aug 2023
- Certified in Syniti Data Migration Methodology - Syniti Jun 2024
- Certified in Advanced Data Migration (ADMM) - Syniti Dec 2024
- SQL (Advanced) Certificate - HackerRank Jan 2026
- AWS Certified Cloud Practitioner - AWS Jul 2026
- AWS Certified AI Practitioner - AWS Jul 2026
- AWS Data Engineer

EDUCATION

Visvesvaraya Technological University Jun 2019
Bachelor of Engineering (B.E.) - Computer Science

Additional Information

Right to Work

- Full right to work in the UK
- No Sponsorship Needed
